Thomas Edison Energy Smart School**

Unit 1 of 5

|   |  |   |                                  |
|---|--|---|----------------------------------|
| Title of the Unit   | <b>Waves and Electromagnetic Radiations.</b>   | Grade Level   | 6th                              |
| Part of the Unit  | A & B  | Time Frame  | 7 week Unit- Sep – October, 2015 |
| Unit Overview   |  |   |                                  |
| <p>Students are able to describe and predict characteristic properties and behaviors of waves when the waves interact with matter. Students can apply an understanding of waves as a means to send digital information. The crosscutting concepts of patterns and structure and function are used as organizing concepts for these disciplinary core ideas. These performance expectations focus on students demonstrating proficiency in developing and using models, using mathematical thinking, and obtaining, evaluating and communicating information; and to use these practices to demonstrate understanding of the core ideas.</p> |  |   |                                  |
| SLO   |  | Corresponding DCI's and PE's  |                                  |
| 1.Use mathematical representations to describe a simple model for waves that includes how the amplitude of a wave is related to the energy in a wave.   |  | MS-PS4-1  |                                  |
| 2.Explain why we can see the color of an object in space but cannot hear sound.   |  | PS4.B   |                                  |
| 3.Use ray diagrams to explain how refracted light and reflected light bring images of distant objects closer and enlarge things that are too small to be observed with an unaided eye.  |  | PS4.B   |                                  |
| 4.Create a simple model that explains the mechanism for how wave pulses are used to save, transmit, and receive information.  |  | PS4.C   |                                  |
| 5.Develop and use a model to describe that waves are reflected, absorbed, or transmitted through various materials.   |  | MS-PS4-2  |                                  |
| 6. Integrate qualitative scientific and technical information to support the claim that digitized signals are a more reliable way to encode and transmit information than analog signals.   |  | MS-PS4-3  |                                  |
| Science and Engineering Practices   | Disciplinary Core Ideas  | Crosscutting Concepts   |                                  |
| <p>Using mathematics and Computational thinking (MS-PS4-1)</p> <ul style="list-style-type: none"> <li>Students model a simple wave with patterns in graphs and charts, including identifying and mathematical representing:</li> <li>A certain distance in which the quantity repeats, or the distance between the maximum and minimum</li> </ul>   | <p><u>PS4 A: Wave Properties</u></p> <ul style="list-style-type: none"> <li>Whether a wave in water, a sound wave or a light wave, all waves have some features in common. A simple wave has a repeating pattern of specific wavelength, frequency and amplitude. The wavelength and frequency are related to one another by the speed of travel of the wave, which for each type of wave is traveling.( MS-PS4-1)</li> <li>Waves are a repeating pattern of motion that transfers energy from place to place without overall displacement of matter.</li> </ul> | <p><u>Scale, Proportion and Quantity</u></p> <p><u>Patterns</u></p> <ul style="list-style-type: none"> <li>Students use graphs and charts can be used to identify patterns in data. **Unit 2 of 5**

|  |   |  |                     |
|--|---|--|---------------------|
| <b>Title of the Unit</b>   | <b>Weather and Climate</b>  | <b>Grade Level</b>   | 6th                 |
| <b>Part of the Unit</b>  | A   | <b>Time Frame</b>  | Nov – December 2015 |
| <b>Unit Overview</b>   |   |  |                     |
| Students construct and use models to develop understanding of the factors that control weather and climate. They take a systems approach to examining the feedbacks between systems as energy from the sun is transferred between systems and circulates through the ocean and atmosphere. The crosscutting concepts of cause and effect, systems and system models, and stability and change are called out as organizing concepts for these disciplinary core ideas. |   |  |                     |
| <b>SLO</b>   |   | <b>Corresponding DCI's and PE's</b>  |                     |
| 1. Develop a conceptual model to explain the mechanisms for the Sun's energy to drive wind and the hydrologic cycle  |   | ESS2.C   |                     |
| 2. <b>Collect data to provide evidence for how the motions and complex interactions of air masses results in changes in weather conditions</b>   |   | <b>MS-ESS2-5</b>   |                     |
| 3. Explain how variations in density result from variations in temperature and salinity drive a global pattern of interconnected ocean currents..  |   | ESS2.C   |                     |
| 4. Use a model to explain the mechanisms that cause varying daily temperature ranges in a coastal community and in a community located in the interior of the country.   |   | ESS2.C; ESS2.D   |                     |
| 5. <b>Develop and use a model to describe how unequal heating and rotation of the Earth cause patterns of atmospheric and oceanic circulation that determine regional climates</b>   |   | <b>MS-ESS2-6</b>   |                     |
| 6. <b>Ask questions to clarify evidence of the factors that have caused the rise in global temperatures over the past century.</b>   |   | <b>MS-ESS3-5</b>   |                     |
| <b>Science and Engineering Practices</b>   | <b>Disciplinary Core Ideas</b>  | <b>Crosscutting Concepts</b>   |                     |
| <ul style="list-style-type: none"> <li>Students develop a model to describe the cycling of water through Earth's systems driven by energy from the sun and the force of gravity.</li> <li>Students Collect data to provide evidence for how the motions and complex interactions of air masses results in changes in weather conditions when air</li> </ul>  | <ul style="list-style-type: none"> <li>The complex patterns of the changes and the movement of water in the atmosphere, determined by winds, landforms, and ocean temperatures and currents, are major determinants of local weather patterns. | <b>Unit</b>              | 3                    | <b>Time Frame</b>  | January 2015 – 4 weeks |

**Unit Overview**

Students examine the Earth’s place in relation to the solar system, Milky Way galaxy, and universe. There is a strong emphasis on a systems approach, using models of the solar system to explain astronomical and other observations of the cyclic patterns of eclipses, tides, and seasons. There is also a strong connection to engineering through the instruments and technologies that have allowed us to explore the objects in our solar system and obtain the data that support the theories that explain the formation and evolution of the universe. The crosscutting concepts of patterns; scale, proportion, and quantity; systems and system models; and interdependence of science, engineering, and technology are called out as organizing concepts for these disciplinary core ideas

**SLO**

1. Generate and analyze evidence (through simulations or long term investigations) to explain why the Sun’s apparent motion across the sky changes over the course of a year.

**2 Develop and use a model of the Earth-sun-moon system to describe the cyclic patterns of lunar phases, eclipses of the sun and moon, and seasons.**

3. Develop and use a model that shows how gravity causes smaller objects to orbit around larger objects at increasing scales, including the gravitational force of the sun causes around it holding together the solar system.

**4. Analyze and interpret data to determine scale properties of objects in the solar system.**

**5. Develop and use a model to describe the role of gravity in the motions within galaxies and the solar system.**

| <b>Title of the Unit</b>   | <b>Structure,<br/>Function and<br/>Information<br/>processing</b> | <b>Grade Level</b>                  | 6th                |
| <b>Unit</b>  | 4   | <b>Time Frame</b>                   | March - April      |
| <b>Enduring Understanding: <i>How do the structures of organisms contribute to life's functions?</i></b>   |   |                                     |                    |
| <b>Unit Overview</b>   |   |                                     |                    |
| <p>Students plan and carry out investigations to develop evidence that living organisms are made of cells and to determine the relationship of organisms to the environment. Students use their understanding of cell theory to develop physical and conceptual models of cells. They construct explanations for the interactions of systems in cells and organisms and how organisms gather and use information from the environment. Students understand that all organisms are made of cells, that special structures are responsible for particular functions in organisms, and that for many organisms the body is a system of multiple interacting subsystems that form a hierarchy from cells to the body. Crosscutting concepts of cause and effect, structure and function, and matter and energy are called out as organizing concepts for these core ideas.</p> |   |                                     |                    |

| <b>Enduring Understanding: <i>How do organisms grow, develop, and reproduce?</i></b>   |  |                                     |                    |
| <b>Unit Overview</b>   |  |                                     |                    |
| <p>Students understand how the environment and genetic factors determine the growth of an individual organism. They also demonstrate understanding of the genetic implications for sexual and asexual reproduction. Students develop evidence to support their understanding of the structures and behaviors that increase the likelihood of successful reproduction by organisms. They have a beginning understanding of the ways humans can select for specific traits, the role of technology, genetic modification, and the nature of ethical responsibilities related to selective breeding. At the end of the unit, students can explain how selected structures, functions, and behaviors of organisms change in predictable ways as they progress from birth to old age.</p> |  |                                     |                    |
